# Predicativity of the Mahlo Universe in Type Theory

Peter Dybjer

joint work with Anton Setzer

TYPES Copenhagen, 10-14 June, 2024

▲□▶ ▲圖▶ ▲ 国▶ ▲ 国▶ - 国 - のへで

## Higher universes and inductive-recursive definitions

- The super-universe (Palmgren)
- The Mahlo universe (Setzer)
- General inductive-recursive definitions (Dybjer, Setzer)

Are they constructive in the sense of Martin-Löf 1979? Are they predicative in Martin-Löf's extended sense?

• Palmgren's paradox: adding a natural elimination rule for the Mahlo universe yields an inconsistency.

▲ロト ▲ □ ト ▲ □ ト ▲ □ ト ● ● の Q ()

# Martin-Löf type theory 1986

#### Two levels:

Theory of types (LF) Dependent type theory with dependent function types  $(x : \sigma) \rightarrow \tau$ , a type Set, and for each *A* : Set a type *A* of elements.

Theory of sets Constants for standard set formers  $\Pi, \Sigma, 0, 1, 2, N, W, Id, \ldots$  and their introductory and eliminatory constants. Equations for the computation rules for eliminatory constants.

The theories IR, IIRD (Dybjer, Setzer 1999, etc) are based on LF. The theory  $TT^{M}$  of this talk is also based on LF.

#### The external Mahlo universe Set

A super-universe is a universe closed under the next-universe operator

 $(-)^+$ : Fam(Set)  $\rightarrow$  Fam(Set)

Similarly, there are super-super-universes, etc.

A further generalization is to build universes  $(U f_0 f_1, T f_0 f_1)$  closed under arbitrary family operators

 $f : \operatorname{Fam}(\operatorname{Set}) \to \operatorname{Fam}(\operatorname{Set})$ 

This turns Set into a Mahlo universe with  $(U f_0 f_1, T f_0 f_1)$  as subuniverses, where *f* is split into two components:

$$\begin{array}{ll} f_0 & : & (X_0 : \operatorname{Set}) \to (X_0 \to \operatorname{Set}) \to \operatorname{Set} \\ f_1 & : & (X_0 : \operatorname{Set}) \to (X_1 : X_0 \to \operatorname{Set}) \to f_0 X_0 X_1 \to \operatorname{Set} \end{array}$$

#### Subuniverses of Set in LF

Introduction rules for the codes  $(c_0, c_1)$  for the family operator  $(f_0, f_1)$ . We omit the arguments for the family operator *parameter*.

$$\begin{array}{rcl} c_{0} & : & (x_{0}: Uf_{0}f_{1}) \rightarrow (Tf_{0}f_{1}x_{0} \rightarrow Uf_{0}f_{1}) \\ & \rightarrow & Uf_{0}f_{1} \\ c_{1} & : & (x_{0}: Uf_{0}f_{1}) \rightarrow (x_{1}: Tf_{0}f_{1}x_{0} \rightarrow Uf_{0}f_{1}) \\ & \rightarrow & Tf_{0}f_{1}(c_{0}x_{0}x_{1}) \rightarrow Uf_{0}f_{1} \end{array}$$

Equality rules:

$$T f_0 f_1 (c_0 x_0 x_1) = f_0 (T f_0 f_1 x_0) ((T f_0 f_1) \circ x_1) T f_0 f_1 (c_1 x_0 x_1 t) = f_1 (T f_0 f_1 x_0) ((T f_0 f_1) \circ x_1) t$$

We also have constructors for codes for the standard set formers. We call the resulting theory  $\mathbf{TT}^{M}$ .

We suggest an answer to this question by

- building a "predicative" (inductively generated) model of TT<sup>M</sup> in classical set theory (ZFC) extended with
  - a Mahlo cardinal M
  - and an inaccessible cardinal I > M
- providing meaning explanations for TT<sup>M</sup> extending and slightly modifying those in Martin-Löf 1979.

### Inductive definitions via rule sets (Aczel 1977)

A *rule* on a base set *U* is a pair of sets  $u \subseteq U$  and  $v \in U$  written

Let  $\Phi$  be a set of rules on U. A set  $w \subseteq U$  is  $\Phi$ -closed iff

$$\frac{u}{v} \in \Phi$$
 and  $u \subseteq w$  implies  $v \in w$ 

 $\frac{u}{v}$ 

There is a least Φ-closed set

$$I(\Phi) = \bigcap \{ w \subseteq U \mid w \ \Phi - \text{closed} \},\$$

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

the set inductively defined by  $\Phi$ . (An impredicative definition!)

# Inductive definition of Tarski-style subuniverses $\mathcal{U} f_0 f_1$

Let M be a Mahlo cardinal and

 $f: \mathcal{F}am(V_M) \rightarrow \mathcal{F}am(V_M)$ 

The Mahlo property implies that there is inaccessible  $\kappa_f < M$  such that f restricts to a function

$$\mathcal{F}$$
am $(V_{\kappa_f}) \rightarrow \mathit{Fam}(V_{\kappa_f})$ 

The following rule set on  $V_{\kappa_f} \times V_{\kappa_f}$  inductively generates the graph of the decoding function  $\mathcal{T} f_0 f_1$  with domain  $\mathcal{U} f_0 f_1$ :

$$\{ \frac{\{(x,X)\} \cup \{(yz,Yz) | z \in X\}}{(c_0 x y, f_0 X Y)} \mid x, X \in V_{\kappa_f}, y, Y : X \to V_{\kappa_f} \}$$

$$\cup$$

$$\{ \frac{\{(x,X)\} \cup \{(yz,Yz) | z \in X\}}{(c_1 x y t, f_1 X Y t)} \mid x, X \in V_{\kappa_f}, y, Y : X \to V_{\kappa_f}, t \in f_0 X Y \}$$

$$\cup$$

٠

## Inductive definition of the Mahlo universe Set

The following rule set on  $V_M$  inductively generates Set:

We add  $\mathcal{U} f_0 f_1$  to  $\mathcal{S}et$  whenever we already know that f (family) composed with  $\mathcal{T} f_0 f_1$  yields a function

```
\mathcal{F}am(\mathcal{U}f_0f_1) \rightarrow \mathcal{F}am(\mathcal{S}et)
```

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

This yields a model of  $\mathbf{TT}^{\mathsf{M}}$ .

# Meaning explanations for **TT**<sup>M</sup>

We assume the canonical forms, computation rules, and matching conditions for the standard set formers (Martin-Löf 1979) adapted to the logical framework version (Martin-Löf 1986). We add:

New canonical forms:

U *f*<sub>0</sub> *f*<sub>1</sub>

 $c_0 a_0 a_1, c_1 a_0 a_1 b$ 

New computation rules:

$$T f_0 f_1 (c_0 x_0 x_1) = f_0 (T f_0 f_1 x_0) ((T f_0 f_1) \circ x_1)$$
  
$$T f_0 f_1 (c_1 x_0 x_1 t) = f_1 (T f_0 f_1 x_0) ((T f_0 f_1) \circ x_1) t$$

## Matching conditions for $U f_0 f_1$ : Set

This judgment is valid under the conditions that

$$f_0(T f_0 f_1 x_0)((T f_0 f_1) \circ x_1)$$
: Set  
 $f_1(T f_0 f_1 x_0)((T f_0 f_1) \circ x_1) t$ : Set

in the context

 $x_0: U f_0 f_1, x_1: T f_0 f_1 x_0 \rightarrow U f_0 f_1, t: f_0 (T f_0 f_1 x_0) ((T f_0 f_1) \circ x_1)$ 

Note the difference between this condition and the assumption of U-formation:

 $f: \operatorname{Fam}(\operatorname{Set}) \to \operatorname{Fam}(\operatorname{Set})$ 

### Well-foundedness

The repeated process of lazily computing canonical forms and checking matching conditions must be well-founded. For example

- *c* : N is only valid if the process of computing successive canonical forms of *c* produces finitely many successors and ends with a final matching 0 : N. (If we get an infinite sequence of successors, then the judgment is not valid.)
- c: WAB must generate a well-founded tree of matchings of canonical forms. The root of the tree is the matching of sup ab : WAB and the subtrees are matchings of the canonical forms of a : A and of bx : WAB for each x : Ba.

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Well-foundedness is a non-trivial issue for the Mahlo universe. Cf Palmgren's paradox.

### Justification of the rules

- Meaning explanations express what the judgments of type theory mean (Martin-Löf 1979).
- Justification of the rules is a second step. It's too much to ask for absolute guarantees for the validity of the inference rules. But we can still provide evidence why we believe they are correct. Martin-Löf 1979:

But there are also certain limits to what verbal explanations can do when it comes to justifying axioms and rules of inference. In the end, everybody must understand for himself.

• We may use any means at our disposal, e g mathematical model building in set theory. When we justify the rules of type theory with Set as a Mahlo universe it parallels the proof that the set-theoretic model is a model of **TT**<sup>M</sup>.
